MIDNIGHT CRATE

WEB Technologies 1 (Front End) | Endterm Project
IT-2509 | Updated 7 November 2026

A working product for the nights that run late

A six-page campus-delivery prototype for students living in dormitories. The Endterm keeps the Midterm topic, team and page structure, while adding an original illustrated night-campus design, dynamic shopping, a validated checkout and an interactive dorm map. All orders are demonstrations; no payment or delivery request is sent.

Repository: github.com/nuar-tech/midterm_WEB
Existing website address: nuar-tech.github.io/midterm_WEB/

Release status: this report documents the tested local Endterm package. The new files have not been uploaded to GitHub because authenticated write access was unavailable. The existing URL must be checked again after the team publishes the package.

Team and development scope

Team member	Page responsibility carried over from Midterm	Endterm scope to review and defend
Dinislam Arafat	Home and About	Hero, ordering steps, project story, team and shared shop/checkout
Komekbay Nurassyl	Menu	Eleven-object catalogue, search, filtering, sorting and cart
Kapizova Aiya	Services and Pricing	Dorm map, delivery calculation, bundle combinations and cost splitting
Aida Mukusheva	Order and Contact	Six required fields, inline validation, live receipt and demo confirmation

Contribution transparency

The page responsibilities above come from the Midterm report. The Endterm implementation, images and documentation were prepared with OpenAI Codex and Imagegen assistance. Each member must review their assigned code and record their actual contribution through their own work and Git commits. This report does not claim that personal Endterm commits or equal contributions have already been verified.

What changed after the Midterm

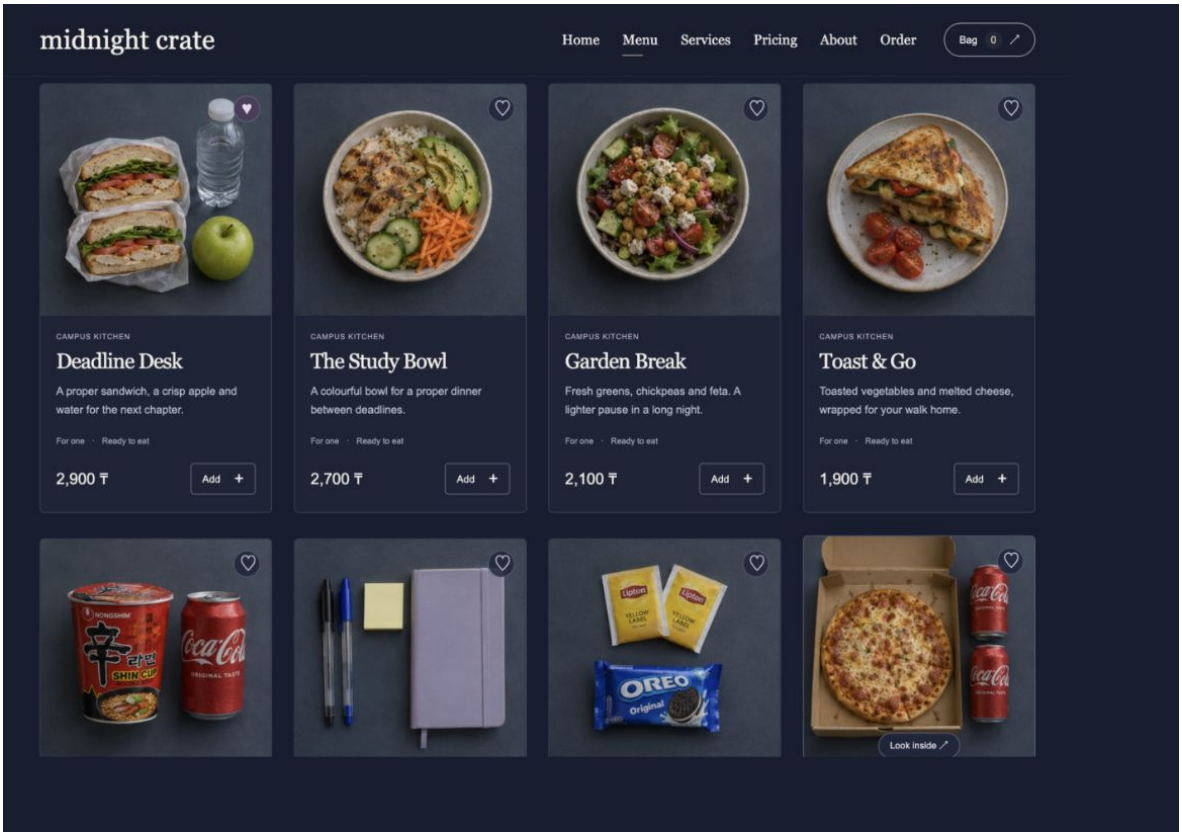

The previous site was primarily static, with six handwritten menu cards and a local order preview. This version renders eleven products from JavaScript objects, supports search/filter/sort, persists a quantity-controlled cart, calculates delivery and order totals, validates contact and time fields, and displays a complete confirmation without reloading.

Addressing the defense feedback

The instructor feedback reported by the team was that the design was too simple and the dormitory map needed more attention. The new visual system uses the user-selected hand-painted campus illustration, indigo/lavender backgrounds, ivory serif typography and soft lamplight accents, clear typographic hierarchy and consistent hover/focus states. The old simple map is replaced with an original interactive isometric campus illustration, including four selectable dormitories and an animated route. Full menus and checkouts no longer repeat across the site; a unified photographic collection, smaller product images and one indigo/lavender visual system replace the mixed styles.

Reported deadline: before Sunday, 8 November 2026. The exact submission time was not supplied. All uploads and real team commits must be completed before the instructor’s cutoff.

Catalogue and shopping

Eleven objects, one consistent catalogue

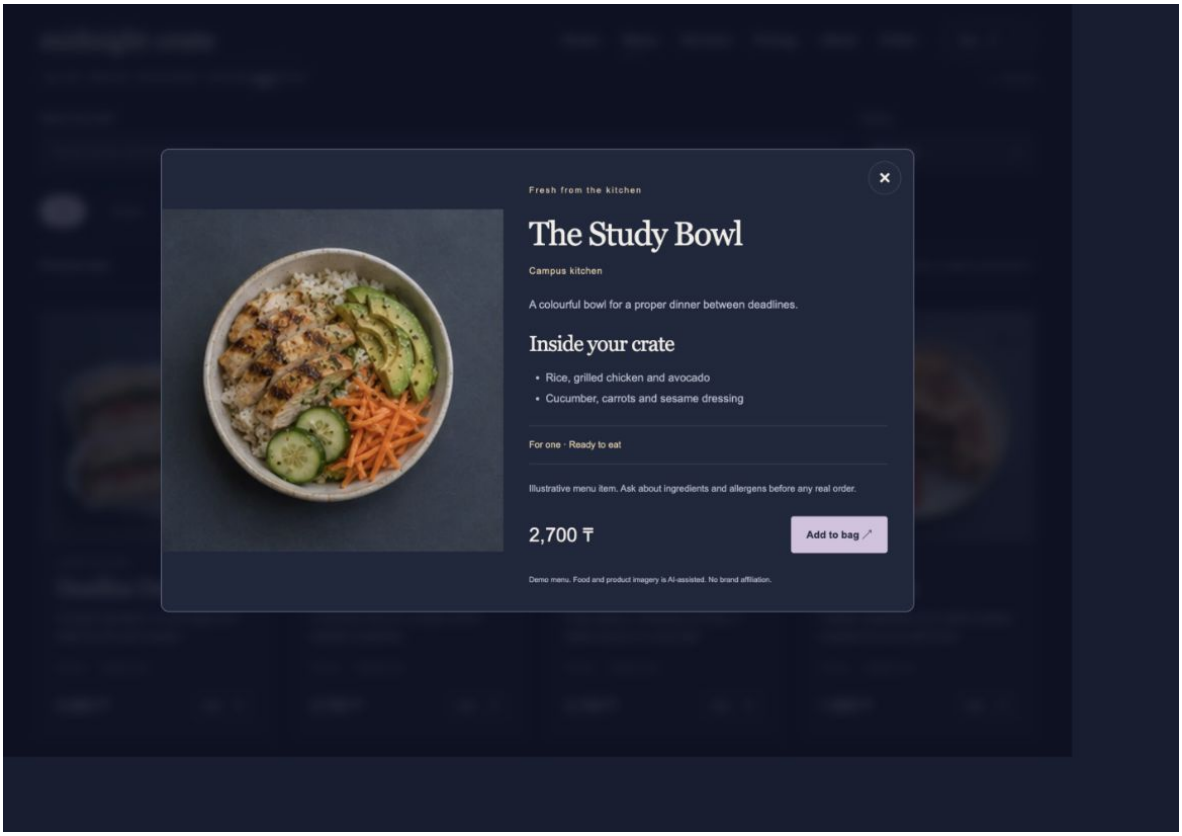

Each product includes id, name, category, price, description, image, brands, contents, preparation notes, suggested sharing and occasion properties. renderCatalog() filters a copy of the array by search, category, occasion, budget and saved picks, applies the selected sort, then creates the cards with DOM methods. It also renders a zero-results state and reset action.

Cart and calculations

Product quantities are held in a cart object and saved to localStorage. Data loaded from storage is validated and quantities are capped at 20 per product. subtotal() uses reduce() to calculate price multiplied by quantity. The bag dialog and checkout receipt update together. Product IDs, quantities and saved-pick IDs are stored, never contact data.

The complete catalogue appears only on Menu, and checkout only on Order. Home has two curated product previews. Other pages share the cart, FAQ and a contextual Campus Desk dialog: six required fields with inline email, name-length and message-length validation, followed by reset and a local success message.

Made for student nights

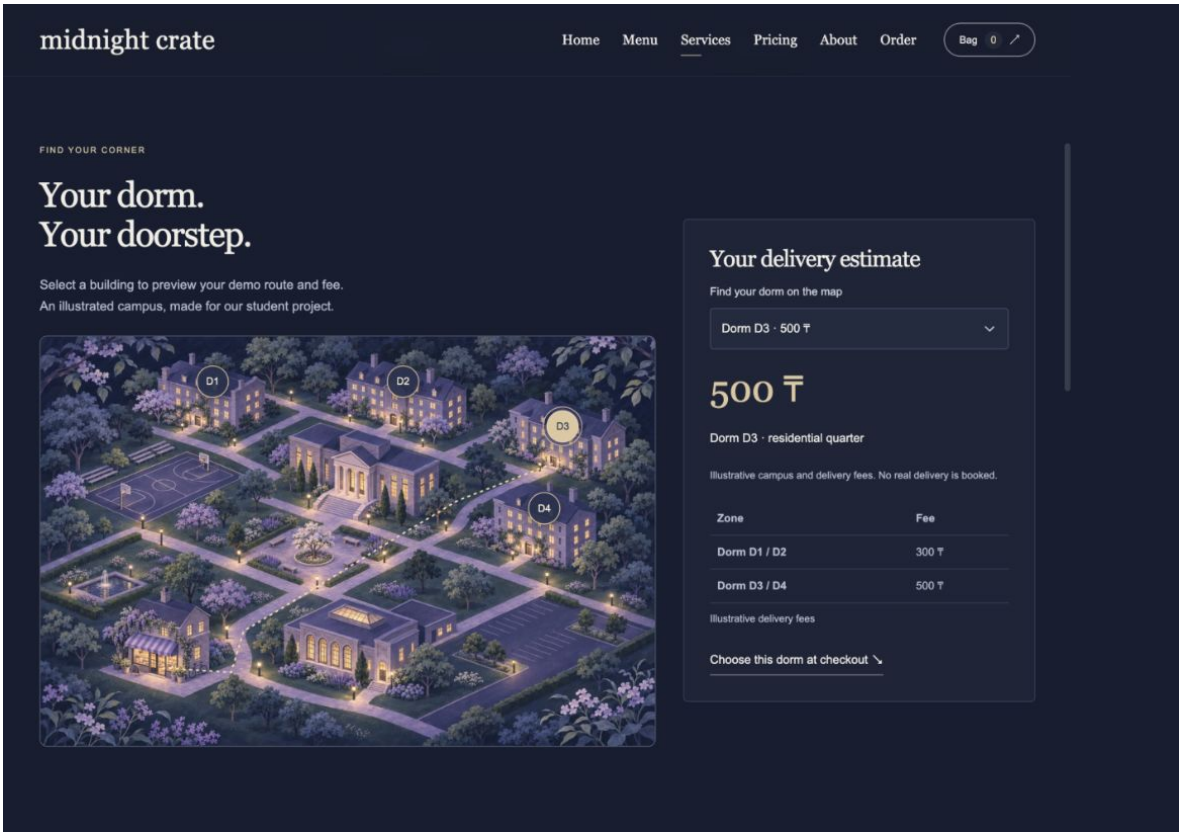

Familiar brands and useful detail

Product dialogs show the exact illustrative contents, preparation notes and sharing suggestions. All eleven catalogue images now share an overhead photographic treatment, blue-grey background, light and scale. The entire site uses one new consolidated stylesheet; previous product images and layered styles are archived outside the site. Deadline Desk now contains a chicken sandwich, apple and water. Three new choices add a chicken-rice bowl, chickpea-feta salad and toasted vegetable sandwich. Brand names identify demo products, without implying affiliation.

The night planner matches occasion, group size and budget. A roommate night for four with a 7,000 KZT budget returns Roommate Table at 6,400 KZT, or 1,600 KZT per person; 3,000 KZT returns a clear no-match result. Both states were checked in the browser. Saved picks and brand search were also checked.

All six pages receive distinct details: editorial campus-life selections on Home, a handoff explanation on Services, a contents comparison on Pricing, student-life scenes on About and reactive checkout steps on Order.

Campus delivery and map

A meaningful location interaction

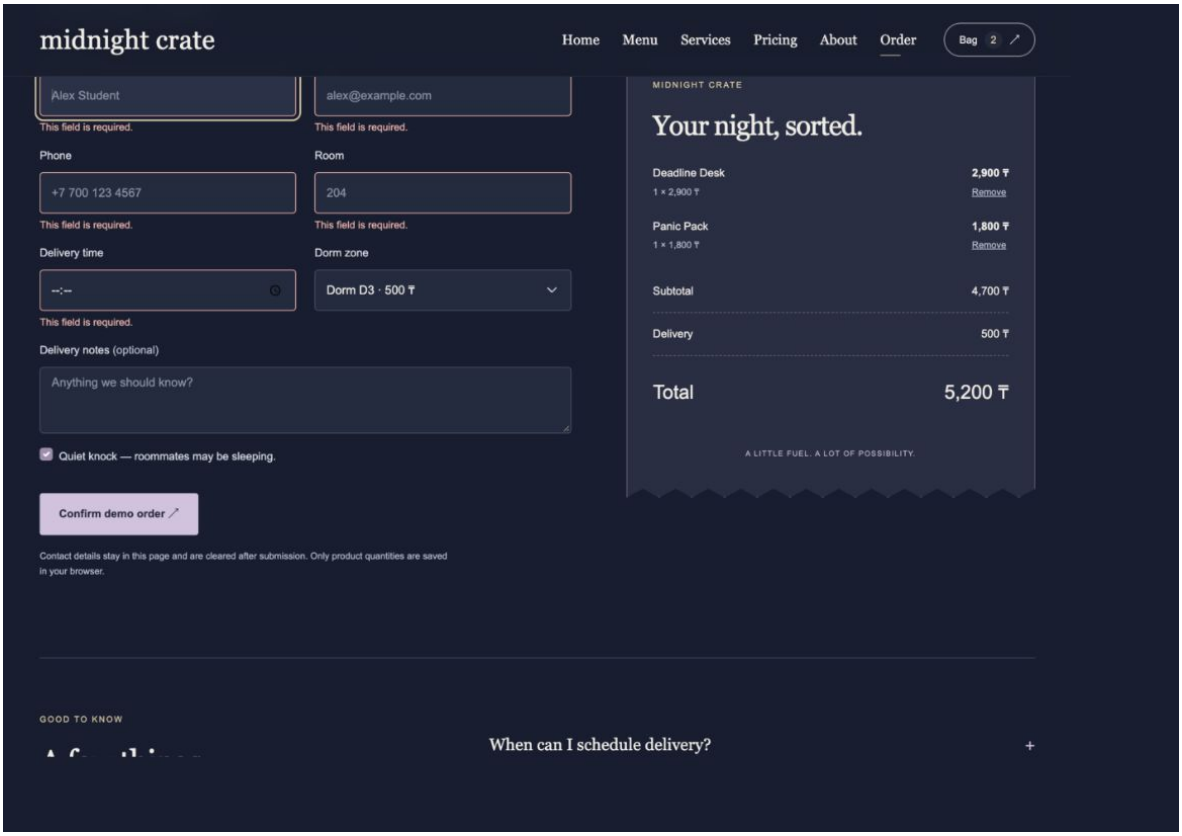

Selecting D1-D4 highlights the building, redraws an animated route and updates the delivery estimate and remembers the dorm for the Order page. D1-D2 use an illustrative fee of 300 KZT; D3-D4 use 500 KZT. The building layout is simplified and not intended for navigation. The campus is conceptual and does not claim to represent a real university.

Map artwork: original OpenAI Imagegen illustration, guided by the user's supplied isometric campus reference and selected night-campus palette. Four HTML building markers and animated SVG routes are overlaid on the artwork. The conceptual map is labelled as such on Services.

Motion that supports the interface

The selected dorm pulses gently and its dotted route moves toward the destination. Product cards and buttons respond to hover; selected sections appear as they enter the viewport. jQuery supplies three distinct effects: accordion sliding, notification fading and smooth scrolling. Repeated clicks stop existing queues. Reduced-motion preferences disable animation.

Order and validation

Clear feedback, field by field

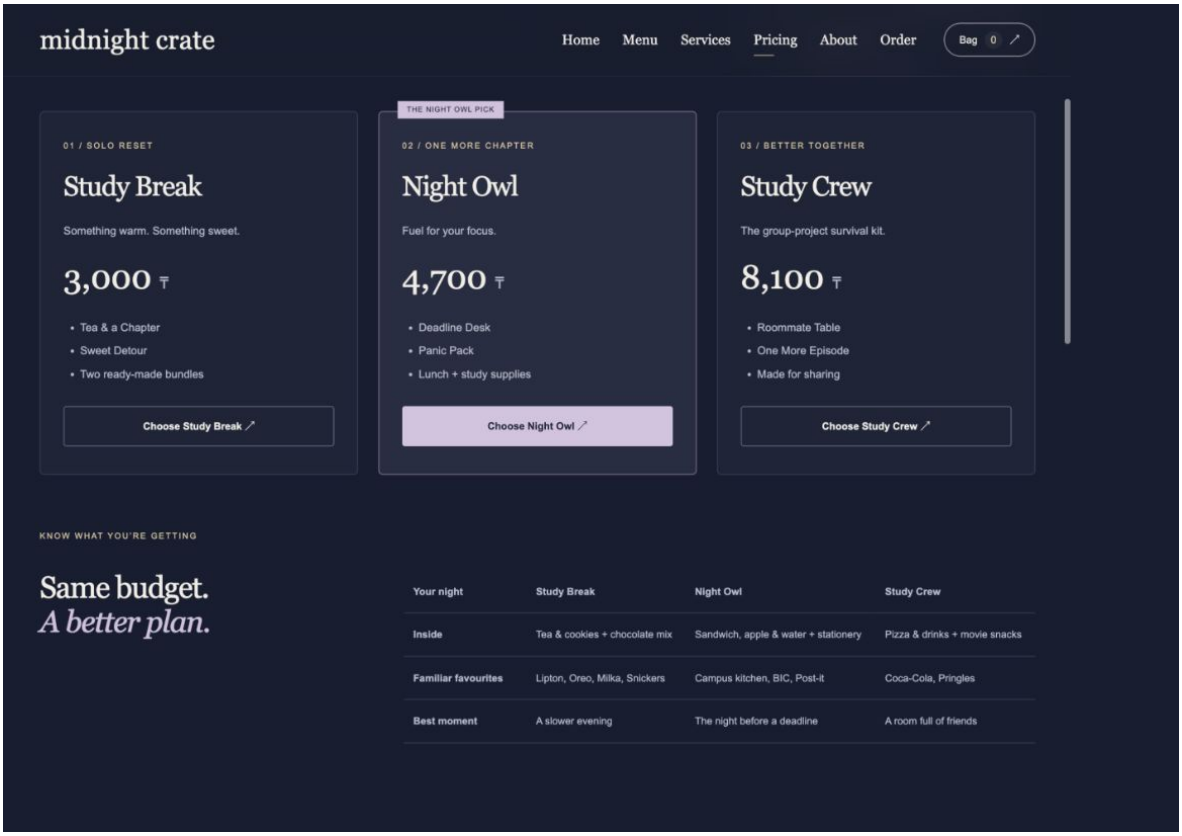

The Bootstrap-based form requires name, email, phone, room, delivery time and dorm. JavaScript checks name length, email syntax, phone format and 10-15 digits, room format and the 20:00-04:00 time window. Errors appear below the field, not in alerts. A touched-field set prevents errors on first load and updates them while the user corrects input.

A successful order

The form prevents a normal network submission. On success it calculates the final total, creates a text-only confirmation, resets every field and empties the cart. The confirmation includes selected dorm, room, time and quiet-knock preference. User-entered text is written with textContent rather than HTML.

Verified example: Deadline Desk 2,900 KZT + delivery to D3 500 KZT = 3,400 KZT. The latest valid test used Night Owl (Deadline Desk plus Panic Pack) and D3 delivery: 5,200 KZT; it cleared the required fields and reset the bag.

Pricing and project identity

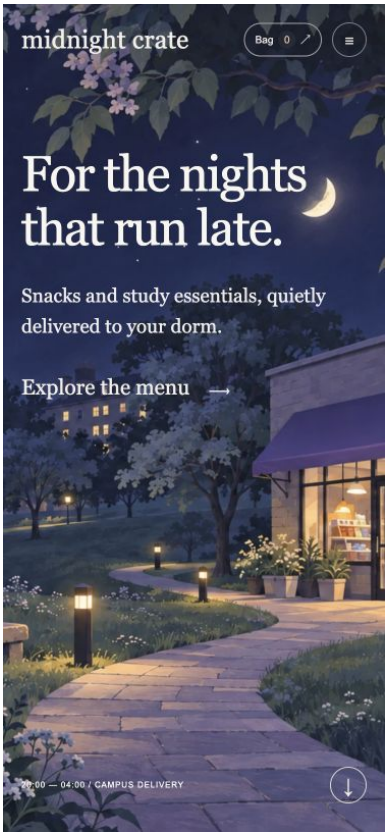

Transparent, one-time combinations

Study Break combines Tea & a Chapter and Sweet Detour (3,000 KZT). Night Owl combines Deadline Desk and Panic Pack (4,700 KZT). Study Crew combines Roommate Table and One More Episode (8,100 KZT). Selecting a combination adds its underlying products to the same cart; delivery is separate. A calculator divides the selected cost among 1-8 people and rejects invalid input.

The About page identifies this as a student project and preserves the four team members and their Midterm page responsibilities. It does not invent customer reviews, operating history or delivery guarantees.

Responsive design and verification

Check	Observed result
6 pages x 3 widths	341, 698 and 1163 CSS px: all 18 combinations had no horizontal overflow and one h1. Menu alone had a catalogue (11 products); Order alone had checkout. All pages loaded the same stylesheet fingerprint.
Form and cart	Empty form; invalid email, phone and time; correction; valid submission; quantity increase; remove/empty; persistence between pages; all passed.
Catalogue	Search with zero results, reset, Study filter and ascending price sort passed.
Map and plans	D4 changed fee to 500 KZT and checkout dorm to D4. Night Owl added 4,700 KZT. Study Crew split among 3 returned 2,700 KZT.
Navigation and motion	Mobile menu opened and navigated to Services. Repeated FAQ toggles preserved state. No JavaScript console errors observed.
Static checks	All local linked resources and anchors exist. No duplicate IDs found in the six HTML pages. JavaScript syntax check passed.

Credits, files and handover

Sources and tools

OpenAI Codex: implementation, design iteration, writing, review and testing assistance. OpenAI Imagegen: original hand-painted night-campus, isometric map and bundle illustrations. Prompts are included in images/NIGHT-ASSET-PROMPTS.txt images/HERO-PROMPT.txt, images/BRAND-ASSET-PROMPT.txt and images/FRESH-FOOD-PROMPT.txt and images/UNIFIED-SHELF-PROMPT.txt. Bootstrap 5.3.3 CSS and jQuery 3.7.1 are distributed locally under their MIT licenses, with upstream attribution. Fonts use the operating system's Georgia and Arial/Helvetica stacks. Interactive map labels are HTML and routes are SVG overlays, keeping text crisp and keyboard accessible. No website template was downloaded.

Bootstrap | jQuery

Project structure

The site/ folder contains index.html, menu.html, services.html, pricing.html, about.html and order.html. Shared styles are in css/site-v5.css; data and behavior are in js/data.js, js/app.js and js/student.js. Optimized local imagery is in images/ and libraries are in vendor/. README.md documents running and publishing. DEFENSE_RU.txt explains the code and individual two-minute demonstration. Screenshots and qa-breakpoints.json record the local checks.

Before submission

Publish the contents of site/ into the root of the existing nuar-tech/midterm_WEB repository. Preserve its history and the page filenames. Each team member should make only genuine contributions and commits under their own identity. Verify the live GitHub Pages URL, then update this report's release status and personal contribution record to reflect what actually happened. Each student submits the ZIP and this PDF, and defends individually.

Limits of verification

The checks cover the local desktop browser and responsive widths, not every physical device or browser engine. The final GitHub deployment and individual team contributions remain unverified. No backend, real payment or real delivery is included or required by the brief.
